## Citation Analysis

Various tools are used to determine how many times, and in what publications, an article is being cited. The presumption is that if an article is cited often, or is cited in prestigious journals, then it is likely to be of a relatively high quality. For more information about citation analysis please see the [Publishing Opportunities in Business](#) LibGuide. Though tailored for business, it can be applicable to other fields of study at Butler.

---

## Google Scholar Citations

Google Scholar Citations (GSC) provides a simple way for SelectedWorks participants to keep track of citations to their articles. You can check who is citing your publications, graph citations over time, and compute several citation metrics. You can also make your profile public, so that it may appear in Google Scholar results when people search for your name.

GSC uses the following indices:

- Total number of citations for all publications
- The *h-index* which reflects both the number of publications and the number of citations per publication
- The *i10-index* which indicates the number of academic papers an author has written that have at least ten citations

To get started simply create a profile at [this link](#).
