This article contains an alphabetical listing of approximately 6,530 trigrams (sets of three consecutive letters) occurring in English words—about 37 percent of the 17,576 theoretically possible trigram arrangements. For each trigram listed, one or more of the commonest English words containing that trigram are included.

In forming this dictionary, we have excluded all personal or place names; the only capitalized words included are the days of the week and the months of the year. By so doing, we have avoided the problem of transliterating foreign place names or searching telephone directories for unpronounceable surnames—an almost endless task. We have excluded hyphenated words when the trigram contains the hyphen; we have excluded abbreviations and acronyms; we have excluded trigrams containing contractions (such as DNT for couldn't). Our basic sources for acceptable English words have been the *Webster's Collegiate Dictionary* editions: the fifth of 1944, and the seventh of 1963. In addition, we have not hesitated to include a few neologisms from such sources as The New York Times, the National Geographic Magazine, and the like. If *Webster's Unabridged Dictionary* were to be used as the primary word source, it is likely that several hundred trigrams conforming to the restrictions above could be added.

It is difficult to draw a firm line in deciding what English words should be included and what should not. Sometimes, words are found both capitalized and uncapitalized (such as Chihuahua, Viking, Stygian). The hyphen is sometimes present and sometimes not (such as tom-tom, high-jack, why-face). When can it be assumed that foreign words have passed into common English usage? Probably no one would quibble with chauffeur, but kok-sagyz (in Webster's seventh) seems much more doubtful. We have included monetary units from various nations (such as markka, qursh and qintal). We have also included a certain amount of modern slang (such as razzmataz, ripnorter, and slugfest), and dialect or regional speech (such as acequia, baudrons, and haaf). Many jaw-breaking technical terms have crept in (such as phenylketonuria, triphenylmethane, hydroxyketone). Each reader must decide for himself where he would draw the line in forming a dictionary of "acceptable" trigrams.

To what uses can a trigram dictionary be put? It can be used as a reference in various parlor games in which successive people add on one letter at a time to a
Dictionary of Common English Trigrams

word-fragment, with the object of forcing the opponent to put the final letter on. It may be of use to crossword puzzle fans and crypt-analysts, helping them to assess the plausibility of a fragment of two or three letters. Readers may perceive uses of which we are unaware, particularly in logological research.

In an appendix to Secret and Urgent (Blue Ribbon Books, 1942), Fletcher Pratt tabulated the observed frequencies of 2,510 different trigrams obtained from a sample of 28,834 trigrams in English prose. Unfortunately, Pratt did not write down the words in which he found his trigrams. In particular, he listed 27 trigrams for which he had been unable to find any suitable English words: ACF, AIR, BJ, BDL, DLL, DNT, DRT, EBC, ECD, EDV, EWJ, EVW, EYV, GYO, HSC, KUT, MRS, NIW, NLS, NTV, ODN, PP, SFF, SFP, WJE, and WYO. It is clear that he must have allowed proper names (such as Admiral Leahy, Wyoming, Pleasantville), abbreviations (Mrs., parts per million, parts per thousand), and contractions (didn't, bo'n). However, many remain a mystery. It is particularly difficult to understand why EWJ appeared four times while WJE appeared but once.

Some of the missing trigrams are probably mistakes in tabulation. In this connection, note that IEM (for which the commonest word is requiem) occurs 29 times in Pratt but IEN not once; UIM (guimp, equimolar) occurs 5 times but UIN not once; VIM (vim, gravimetric) occurs 14 times but VIN not once.

Should this dictionary have been compiled with the aid of an electronic computer? At first, it seems as if it might be a much faster and more accurate method. However upon closer examination the task of compiling a trigram dictionary by computer is not a trivial one. Basically, one can consider two sources— the dictionary, and random English prose. Let us consider each possibility in turn.

Although it would be a lengthy task to key-punch 100,000 words or more from the dictionary (all variant spellings, adverbs formed from adjectives, nouns formed from adjectives, and so forth), it is within the realm of possibility. The problem arises in the selection of the commonest English words associated with each trigram. If one lets the computer print out all the trigrams associated with 100,000 words, and if we assume that the average word produces 6 different trigrams, then each of the 6,000 different trigrams in the printout will contain 100 examples on the average (many will contain thousands). We can see no easy way of scanning this mass of material and picking out the commonest words for each trigram.

If one processes random English prose through the computer, the problem of selecting the commonest words for each trigram is considerably eased—one need print out only the first five to twenty different occurrences of each trigram and have some assurance that reasonably commonplace examples are included. However, as Fletcher Pratt discovered, in order to assemble a respectable number of different trigrams one needs to scan a tremendous amount of prose; the job of preparing this prose in a form the computer can read would be time-consuming and expensive.

In order to estimate the magnitude of this job, we use Pratt's statistics to determine the average number of trigrams that must be scanned to obtain (say) 6,680 different trigrams. As already noted, Pratt obtained 2,510 different trigrams in a sample of 28,834. If he had sampled half this number, one would have expected one-half of his single-occurrence trigrams, three-quarters of his double-occurrence trigrams, seven-eighths of his triple-occurrence trigrams, etc., to occur. Carrying out
In this calculation, we estimate that Pratt would have found about 410 fewer different trigrams in a sample of 14,417. If one halves the sample a second time, the number of different trigrams is reduced by 831; if one halves it a third time, by 1250. From this, one can use as a rough extrapolation the rule that 417 new trigrams are added every time the sample is doubled. The difference between 6,680 and 2,510 is 4,170—one needs to expand Pratt's sample by a factor of two raised to the tenth power, or 1,024. This works out to nearly 30 million trigrams—about the number contained in ten volumes of the Encyclopedia Americana.

In his 1965 Michigan State University doctoral thesis, "A Model for the Distribution of Individuals by Species in an Environment," statistician John W. McClovery suggests a somewhat different model to which Pratt's data can be fitted. Without going into details, his model suggests that only 15 million trigrams need be sampled. Although these two estimates clearly illustrate the pitfalls of long-distance extrapolation, the moral is obvious—mining trigrams out of English prose is likely to be an expensive job.

The authors acknowledge the help in locating trigrams of their daughters Lois and Peggy, of A. Ross Eckler, Sr., of Mary Lois Dennison, and of Marvin Epstein.
