IN QUEST OF A PANGRAM (PART 2)

LEE SALLOWS Nijmegen, The Netherlands

Looking back on it, I suppose the failure of the Pangram Machine Mark I was a piece of good fortune. I mean, otherwise the faster Mark II model might never have come into existence. Another advantage of the latter was that different initial text constraints could be easily entered via front panel controls, without need of rewiring. This meant I could experiment at will, confined only by the initially chosen set of number-word ranges, an important limitation, but still granting much scope.

I had a lot of fun with the Pangram Machine in the ensuing months. One early find was a sort of deadpan-gram l couldn't resist sending off to Rudy Kousbroek:

This pungram boasts four a's, two b's, one c, two d's, twenty-eight e's, seven f's, three g's, five h's, nine i's, one j, one k, one l, two m's, twenty n's, fifteen o's, two p's, one q, five r's, twenty-seven s's, twenty-one t's, three u's, six v's, ten w's, two x's, five y's and one z

A magic translation of this into Dutch has not reached me, as yet. Another example which seemed worth drawing to his attention:

This pangram containeth five a's, one b, two c's, two d's, twenty-five e's, seven f's, two g's, four h's, ten i's, one j, one k, two m's, twenty n's, sixteen o's, two p's, one q, five r's, twenty-six s's, twenty-one t's, three u's, six v's, ten w's, four x's, five y's, and one z

I don't know whether he believed my tale of it having turned up among the marginalia in a folio edition of Macbeth. Probably not. The Dutch have never entirely succeeded in throwing off the legacy of German Scepticism.

For a while I reconnoitered without any clear plan. Pangrams incorporating names of friends provided entertainment. Many new specimens were thus unearthed and the relation between initial text constants and the ranges in which solutions could be expected became clearer. After a time, the facility gained in prospecting prompted an ambitious new research program.

A shortcoming of logology, I find, is its absence of underlying structure. Like mathematics, it manifests itself in precisely defined chains of atomic symbols, yet lacks the intrinsic patterning, the symmetry of the former. Self-descriptive sentences, however, embody a strange fusion of both fields, an unlikely marriage of arbitrary convention with arithmetical necessity. A wish to extend this dualism was thus natural, and before long the idea of a

counterpart to a **number** series suggested itself: This first pangram ..., This second pangram ..., This third pangram The upshot can be seen in the accompanying table of 100 ordinal pangrams, the singular legacy of a singular device. Number-words are represented by digits. Note the use of a different verb in each case. This is not always necessitated, since the same word combined with different ordinals may also generate solutions. The use of a new verb each time seemed to me demanded on esthetic grounds.

In the meantime I made up some new plug-in matrix cards implementing different number-word ranges so as to cast a wider net able to embrace certain kinds of non-pangrams:

This sentence employs two a's, two c's, two d's, twenty-eight e's, five f's, three g's, eight h's, eleven i's, three l's, two m's, thirteen n's, nine o's, two p's, five r's, twenty-five s's, twenty-three t's, six v's, ten w's, two x's, five y's, and one z

The apparent elegance of such sentences can be deceptive. Closer scrutiny may reveal imperfections. For instance, oughtn't "one z" to be seen as a redundant curlicue? Its inclusion is clearly a gratuitous addition whose only apparent function is to contribute an extra o, n and e, merely in order to make the sentence work. Appending number-words is just a cunning form of disguised text-doctoring. Perhaps those with a sneaking affection for the solitary z will find consolation in:

This sentence contains three a's, three c's, five f's, three g's, eight h's, thirteen i's, two l's, sixteen n's, nine o's, six r's, twenty-seven s's, twenty-two t's, two u's, five v's, eight w's, four x's, five y's, and only one z

Here the inclusion of "only" legitimizes the addition of "one z" by "proving" it was premeditated. Even so, the choice of letter remains arbitrary: a q would have done just as well. Purists, however, will reject all q's, whether straight or curly, and rightly insist on the crisp parsimony of:

This sentence employs two a's, two c's, two d's, twenty-six e's, four f's, two g's, seven h's, nine i's, three l's, two m's, thirteen n's, ten o's, two p's, six r's, twenty-eight s's, twenty-three t's, two u's, five v's, eleven w's, three x's, and five y's

It is odd to realise that the existence of this minimal form seems to vitiate the objection raised against the first version: "one z" may be redundant, but it couldn't have been thrown in just to make the sentence work! Such considerations should be kept in mind when comparing different specimens.

Bimagic Pairs and Bananagrams

At a still later stage I constructed a second set of matrix cards representing number-words in Dutch. Besides another series of ordinal pangrams, sone of the fruits of this excursion into a new language was:

Int: shi pangrams A B C D E F G E I J E L N N N O P Q R S T U V V N N N D S Q R S T U V V N X I Z Int: has 5 1 2 2 29 6 4 8 12 1 1 2 2 29 6 6 4 8 12 2 1 1 3 2 2 16 2 1 8 26 20 3 5 9 3 4 4 1 3 7 3 5 1 3 7 4 0 0 1 1 1 2 2 2 1 6 2 1 8 26 20 3 5 9 3 4 4 1 1 1 2 2 1 1 1 1 2 2 2 1 6 2 1 8 26 20 3 5 9 3 4 4 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1

Dit pangram bevat maar negen a's, twee b's, vier c's, vier d's, drieënveertig e's, twee f's, zeven g's, vier h's, vijftien i's, twee j's, een k, een l, drie m's, twintig n's, een o, twee p's, een q, negen r's, twintig s's, achttien t's, een u, acht v's, acht w's, een x, een y, en twee z's

That is, "This pangram contains but nine a's, two b's, ..., etc., one y, and two z's." This may seem unremarkable but being in Double-Dutch we still have the second half to come:

Maar dit pangram bevat acht a's, twee b's, drie c's, vijf d's, eenenveertig e's, vijf f's, zes g's, drie h's, zeventien i's, vijf j's, een k, een l, drie m's twintig n's, een o, twee p's, een q, acht r's, tweeëntwintig s's, vijftien t's, een u, negen v's, zes w's, een x, een y, en vier z's

That is, "But this pangram contains eight a's, two b's, ..., etc., one y, and four z's." The peculiar thing here is that although differing in the number-words they use, the two pangrams exhibit (essentially) identical texts. Or, to put it the other way around: although the words used are the same, the pangrams list different numbers of letters! Certain minds seem to balk at this confrontation with a single text composed of nine a's this time and eight the next. I have even known the delight of hearing someone patiently explain to me that such a thing can only be a logical impossibility!

Logic, however, should never be confused with logologic. The sentences above are of course no more than a single text to which two solutions have been found. The possibility of such bimagic cases had been in my head from the start. Though at first sight twisty, the cunning interlock between bimagic pairs is neatly brought out through considering the following two lists:

ten i's eleven i's one l two l's eighteen t's nineteen t's seven w's eight w's

The four numbers on the right are all one greater than those on the left, a difference on the descriptive level of one i, one l, one t, and one w. But cancelling common letters in the two lists will leave precisely that: the text on the right contains an extra i,l,t and w. Denotational differences parallel those at the typographical level. A self-descriptor incorporating one of these lists remains a self-descriptor if that list is replaced by the other. A similar but more complicated pair of lists can be extracted from any bimagic solution.

Notice that despite suggestive associations, a pair of sublists so derived can never comprise true anagrams of each other. For if their letter content agreed then the numbers named would have to be the same, which would imply identity. Taking into account their slippery character and the ban on anagrams, I propose a special name for these curiosities: bananagrams. Beside their occurrence in bimagic self-descriptors, a search for bananagrams could easily form a study in its own right.

How rare are bimagic cases? Of the roughly one in eight initial texts to yield a simple self-descriptor, again something like one in eight of these turn out to have dual solutions. Is this coincidence, or might a theory be developed for predicting it? Trimagic cases are naturally even rarer. Several hundred runs with the machine have located only one, its unpleasing text being "This twenty-first pangram scored...". A finer example of the polymagic genre is seen in a near translation of the Dutch pair above. Here, the false modesty of the first is countered by the second one turning the tables:

This pangram tables but five a's, three b's, one c, two d's, twenty-eight e's, six f's, four g's, six h's, ten i's, one j, one k, three l's, two m's, seventeen n's, twelve o's, two p's, one q, seven r's, twenty-nine s's, twenty t's, five u's, six v's, eight w's, four x's, four y's, and one z

But this pangram tables five a's, three b's, one c, two d's, twentynine e's, six f's, six g's, eight h's, eleven i's, one j, one k, three l's, two m's, seventeen n's, fourteen o's, two p's, one q, eight r's, twenty-eight s's, twenty-two t's, six u's, four v's, eight w's, four x's, four y's, and one z

So much then for the products of the Pangram Machine. Far from everything has found room for inclusion here, the charm of such curiosities being limited, with one self-descriptor soon seeming much like another. But one sting in the tail deserves another. Kousbroek's challenge was to produce a magic translation of his pangram. Having offered one, I should like to present another. it is the second half of what he had never imagined, a bimagic translation. The first is repeated alongside:

This pangram contains four a's, one b, two c's, one d, twenty-six e's, six f's, three g's, six h's, eleven i's, one j, one k, two l's, two m's, seventeen n's, fifteen o's, two p's, one q, eight r's, thirty s's, seventeen t's, four u's, four v's, six w's, six x's, three y's, & one z

This pangram contains four a's, one b, two c's, one d, thirty e's, six f's, five g's, seven h's, eleven i's, one j, one k, two l's, two m's, eighteen n's, fifteen o's, two p's, one q, five r's, twenty-seven s's, eighteen t's, two u's, seven v's, eight w's, two x's, three y's, & one z

An act of magic consists in doing what others believe impossible. The magic of self-descriptive sentences lies in the unbelievable coincidence they effect between a message and its medium. This is a good example of what Freud would have called an over-determined structure: over-determined because it simultaneously satisfies independent sets of demands. Of course, a discipline devoted to over-determined texts already exists: a technical field in which distillation of meaning and coalescence of form with content have ever been focal concepts. Its name is poetry. Let none suppose that anything but poetry has been our purpose here.
